

Tips for Effective Facilitating

SCRATCH DAY

Use these facilitator tips to help guide participants during your Scratch Day.

Ask questions rather than giving answers

It may be tempting to give the answers to questions right away, but if it's possible, ask questions instead so that learners can arrive at their own answers. Even something as simple as "Can you explain what your program does? What do you want it to do?"

Build trust and relationships

Learning is a social process. Get to know your learners and help them get to know you. Learning new things requires learners to be open and vulnerable. Being around people that they know and trust can facilitate the learning process.

Use technical words cautiously

Be aware of the words you use. Avoid technical jargon. If you have to use it, use it as a learning opportunity to explain the jargon. Focus the energy, time, and attention on supporting the creative process, not solving technical problems.

Encourage exploration, experimentation, and risk-taking

Gently encourage participants to move out of their comfort zones to try new activities, concepts, or projects. Remixing other people's projects is a great way to explore new ideas!

Authentic enthusiasm goes a long way

Sometimes learners, especially beginners, can feel unsure about their projects. Some encouragement or cheerleading can help them feel good about their work and their next steps.

Be a connector

Connect learners with similar interests to each other and to relevant resources in the workshop. Model values of creativity and connection.

Put yourself in their (unique) shoes

Empathize with learners to better understand their motivations and actions. Consider what creates a joyful, safe environment for the group.

Surface their interests

It can sometimes take time for people to know what they want to do. Create an environment that is open to many interests. Ask questions like "What do you like to do?" Celebrate the variety of projects in progress!

Hold the tools as a last resort

It's tempting to grab the mouse, but try describing the steps rather than doing it for learners. If you have to navigate the tools, let them try it again for themselves after you show them and guide them along.

Mistakes and failures are welcome

Get really excited when something goes wrong! Rather than avoiding mistakes, encourage learners to be open to them. As you support them through their work, help them see what they are learning in the process.

Facilitation Prompts

Print out and share these creative learning prompts with facilitators to refer back to throughout the event.

Imagine

What new things did you try out?

Can you tell me more about that?

Let's test it out.

Walk me through your code. What does it say?

If using Scratch cards, start with the front and ask: "How might we do this?" before flipping it over.

I don't know, but let's find out together.

I don't know, but let's see if anyone else in the room might know.

Have you looked at others' projects? What did you learn from them?

What are your next steps for this project? What do you want to do in the future?
